There exists a non-constant differentiable function  $f : \mathbb{R}^2 \to \mathbb{R}$ such that, for some fixed nonzero  $h \in \mathbb{R}^2$ , we have

$$df_a(h)=0$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

for all points  $a \in \mathbb{R}^2$ .

The function  $f : \mathbb{R}^2 \to \mathbb{R}$  given by f(x, y) = |xy| is differentiable at the origin.

3. Draw pictures of the function  $f(x, y) = (x, y^2)$  until you can see why this function is called a "fold."

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Then calculate the set of all critical points of f.

If  $f: \mathbb{R}^3 \to \mathbb{R}$  is differentiable at 0 and

$$f'(0) = \begin{bmatrix} 3 & -1 & -2 \end{bmatrix},$$

then  $\partial_{(1,1,1)} f(0) = 0$ .

If  $f: \mathbb{R}^2 \to \mathbb{R}$  is given by  $f(x, y) = 2(x - 1) - 3y + y^2$ ,

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

then  $df_{(1,0)}(h,k) = 2h - 3k$ .

Single variable review!

**Recall**. If *I* is an open interval, a function  $f : I \to \mathbb{R}$  is defined to be *concave up* if

$$\frac{f(y)-f(x)}{y-x} \leq \frac{f(z)-f(y)}{z-y}$$

for all x < y < z in I.

6. Show that, if  $f : I \to \mathbb{R}$  is concave up and f'(a) = 0, then *a* is an absolute minimum of *f*.

7. Suppose  $f : \mathbb{R} \to \mathbb{R}$  is differentiable, f(0) = 0, and f' is increasing. Prove that the function  $g : (0, \infty) \to \mathbb{R}$  given by

$$g(x)=\frac{f(x)}{x}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

is increasing.
